

(Design of Irrigation Works III)

N.B.

- This examination is open book exam and the use of lectures notes and text books is permitted.
- Any missing data may be reasonably assumed
- Total mark : 50 marks.

**Question. 1**

(12 marks)

- Discuss the different forces acting on gravity dam.
- Discuss the environmental impacts of dams.
- Discuss the classification of dams based on
  - hydraulic criteria and
  - stability criteria.
- Why are spillways necessary in dams? Give a list for the classification of spillways.
- Discuss the typical cycle of functioning of Syphon Spillway.

**Question. 2**

(12 marks)

- Use the given annual inflow time series (Table 1) to calculate the long-term storage capacity of the reservoir.
- Use the shown mass inflow curve (Figure 1) to calculate the annual storage capacity of the reservoir assuming that: the monthly demand is 18 million m<sup>3</sup>, the accumulated inflow at the apices e and g are 466 and 675 million m<sup>3</sup> respectively and the accumulated inflow at f and i are 470 and 691 million m<sup>3</sup> respectively.

**Question. 3**

(26 marks)

- Panchet dam was constructed across the Damodar River (India). It is mainly an earthen dam with a concrete gravity Ogee-shaped spillway in the river bed near the left bank. Determine the maximum flood discharge for the ogee gated spillway for following conditions:
  - Pier have rounded nose. Abutment radius = 5 m, and approach wall at 29° from flow axis,
  - Normal conservation level = 105.00 m,
  - maximum flood surcharge = 1.90 m,
  - Spillway crest level = 94.0 m,
  - Width of pier 2.44 m,
  - Width of bay 16.15 m,
  - Total number of bays 10,
  - Approach channel floor level = 87.0 m, length = 120 m.
- Design a syphon spillway for the following data:
  - High flood discharge (Q) = 1050 m<sup>3</sup>/sec,
  - Full reservoir level = (97.45) m,
  - High flood level = (98.35) m,
  - Level of center of the outlet = (91.90) m.

My best wishes

Prof. Dr. Mahmoud Elgamal  
Dr. Samer Elabd
