# Synthesis and Characterization of Some Novel Metal Complexes Derived from Oxalic Acid Dihydrazide 

Sara A. Sadak, Nagawa A. Nawar, Mohsen M. Mostafa*<br>Chemistry Department, Faculty of Science, Mansoura University, Mansoura, Egypt<br>* Corresponding author (MM. Mostafa: amohsenmostafa@yahoo.com \& dr_mohsen@mans.edu.eg

|  | Abstract: Complexes of oxalic acid dihydrazide ( $\mathrm{ODH}, \mathrm{L}^{1}$ ) with $\mathrm{Co}^{2+}, \mathrm{Ni}^{2+}, \mathrm{Zn}^{2+}$, and $\mathrm{Pd}^{2+}$ salts were isolated and characterized by elemental analyses, spectral (IR, Uv-Vis., mass), TGA, and magnetic measurements. The complexes are of the types, $\left[\mathrm{Ni}_{2}(\mathrm{ODH}-\right.$ $\left.\mathrm{H})(\mathrm{OH})_{2}\left(\mathrm{CH}_{3} \mathrm{OH}\right)_{2} \mathrm{H}_{2} \mathrm{O}\right] . \mathrm{H}_{2} \mathrm{O}$, <br> [ $\left.\mathrm{Ni}(\mathrm{ODH}-\mathrm{H})\left(\mathrm{H}_{2} \mathrm{O}\right)_{2} \mathrm{Cl}\right]$, <br> $\left[\mathrm{Co}_{2}(\mathrm{ODH}-2 \mathrm{H}) \mathrm{Cl}_{2} \mathrm{H}_{2} \mathrm{O}\right)_{6}$ $\left.\mathrm{CH}_{3} \mathrm{OH}\right] \cdot 3 \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Zn}_{3}(\mathrm{ODH}-\mathrm{H})_{2}\left(\mathrm{OCH}_{3}\right)_{2}\left(\mathrm{CH}_{3} \mathrm{OH}\right)_{2}\right] \cdot \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Co}(\mathrm{ODH}-\mathrm{H})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]$, and $\left.\left[\mathrm{Pd}_{3}(\mathrm{ODH}-\mathrm{H})_{2} \mathrm{Cl}_{4}\right]\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right] \cdot 2 \mathrm{CH}_{3} \mathrm{OH}$. In the first three complexes, the ligand behaves in a bidentate manner; and is coordinated through NH and the enolized carbonyl oxygen groups with a removal of a proton from the latter group. Also, it acts as a bidentate ligand coordinated through the enolized $(\mathrm{C}=\mathrm{O})$ and $(\mathrm{C}=\mathrm{N})$ groups with the removal of a proton from the former group forming a five-membered ring around the $\mathrm{Co}^{2+}$ ion in the complex, $\left[\mathrm{Co}(\mathrm{ODH}-\mathrm{H})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]$. Finally, two ligands bonded three $\mathrm{Pd}^{2+}$ ions in which the terminal two palladium ions are bonded through the $(\mathrm{C}=\mathrm{O})$ and the $(\mathrm{C}=\mathrm{N})$ moieties forming two five-membered rings around the $\mathrm{Pd}^{2+}$ ions, while the intermediate $\mathrm{Pd}^{2+}$ ion is coordinated to two NH and two enolized carbonyl oxygen with the removal of two protons forming two five-membered rings around the $\mathrm{Pd}^{2+}$ ion. The geometries of the complexes were determined depending on the spectral and magnetic measurements. |

## 1. Introduction

Acid hydrazides have been the subject of many previous papers. We reported earlier the coordination of some simple aliphatic acid hydrazides up to isobutyric acid (IBH) [I]. Also, cinnamic acid hydrazide (CAH) forms complexes with different $\mathrm{M}^{2+}$ cations derived from the $3 d$-metal ions [2]. The route of coordination with acid hydrazides for these complexes has been a matter of some discussion. Thus, some authors [3] claim to synthesize complexes with hydrazides bonded via the carbonyl oxygen, while other authors favor bonding through the $\mathrm{NH}_{2}$ group and the carbonyl group or via the carbonyl group only [4]. Another possible mode of coordination proceeds using the NH group as reported by Ahmed and co-workers [5].

On the other hand, the complexes derived from oxalic acid dihydrazide ( $\mathbf{O D H}$ ) with some vital bivalent transition metal salts serve as models of biological systems, for example, of protein compounds with some metal ions, and for the synthesis of pharmacological substrates.

In earlier communication, we reported earlier the synthesis and characterization studies of some mono hydrazides with $3 d$-metal ions [612]. Herein we report some metal complexes of oxalic acid dihydrazide (ODH) with some metal ions. This study aimed to explore the coordination behavior of this ligand towards some divalent metal ions $\left(\mathrm{Co}^{2+}, \mathrm{Ni}^{2+}, \mathrm{Cu}^{2+}\right.$, $\mathrm{Zn}^{2+}$, and $\mathrm{Pd}^{2+}$ ) in the presence and/or absence of sodium acetate. Also, the structure of the ligands and new metal complexes were identified by elemental analyses, spectral (IR, UV, mass), TGA, and magnetic measurements for some selected metal complexes.

## 2. Experimental

The chemicals utilized were of the purest grade and purchased from Aldrich and used without further purification.
2.1. Synthesis of $\mathbf{L}^{1}(\mathbf{O D H})$ Hydrazine hydrate ( $6.27 \mathrm{~mL}, 0.2$ mole) was added drop by drop to diethyl oxalate ( $13 \mathrm{~mL}, 0.1 \mathrm{~mole}$ ) in ethanol solution ( 20 mL ) with stirring for $15 \mathrm{~min} . \mathbf{L}^{1}$
(oxalic acid dihydrazide) was obtained as a white solid, then filtered and washed successively with EtOH followed by diethyl ether, and then dried in a vacuum over anhydrous $\mathrm{CaCl}_{2}$ in a desiccator.

### 2.2. Synthesis of metal complexes

### 2.2.1. Synthesis of $\mathrm{Cu}^{2+}, \mathrm{Ni}^{2+}, \mathrm{Co}^{2+}$, and $\mathrm{Zn}^{2+}$ complexes

$\mathbf{L}^{1}(5 \mathrm{mmol}, 0.6 \mathrm{mg})$ was dissolved in dist. $\mathrm{H}_{2} \mathrm{O}(25 \mathrm{~mL})$ with the heating on a hot plate and $\mathrm{NiCl}_{2} .6 \mathrm{H}_{2} \mathrm{O}(5 \mathrm{mmol}, 1.18 \mathrm{mg})$ was dissolved in a small quantity of methanol (20 mL ). The resulting solution was boiled under reflux for 30 min . (1:1). The complex, $\left[\mathrm{Ni}_{2}(\mathrm{ODH}-\mathrm{H})(\mathrm{OH})_{2} \quad\left(\mathrm{CH}_{3} \mathrm{OH}\right)_{2} \mathrm{H}_{2} \mathrm{O}\right] \cdot 2 \mathrm{H}_{2} \mathrm{O}$, obtained as a solid was filtered; and washed with dist. $\mathrm{H}_{2} \mathrm{O}+\mathrm{MeOH}$ followed by diethyl ether. The $\mathrm{Co}^{2+}$ complex with the general formula, $\quad\left[\mathrm{Co}(\mathbf{O D H}-\mathrm{H})_{2} \quad\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]$, was synthesized by dissolving $\mathrm{CoCl}_{2} .6 \mathrm{H}_{2} \mathrm{O} \quad(5$ $\mathrm{mmol}, 1.89 \mathrm{~g}$ ) in the least quantity of methanol $(20 \mathrm{~mL})$ followed by adding to the ligand ( 10 $\mathrm{mmol}, 1.18 \mathrm{~g}$ ) dissolved in 25 mL of dist. $\mathrm{H}_{2} \mathrm{O}$. The mixture was heated under reflux for 30 min on a water bath. The solution was found to have a pH in the 5-6 range. The product was obtained by filtration, and then washed with a mixture of dist. $\mathrm{H}_{2} \mathrm{O}+\mathrm{MeOH}$ followed by diethyl ether.

The metal salts $\left[\mathrm{NiCl}_{2} .6 \mathrm{H}_{2} \mathrm{O},(2.37 \mathrm{~g}, 10\right.$ mmol ), $\mathrm{CoCl}_{2} .6 \mathrm{H}_{2} \mathrm{O}$ ( 2.37 mmol ), and $\mathrm{ZnCl}_{2}$ $(1.36 \mathrm{~g}, 10 \mathrm{mmol})]$ were disbanded in methanol $(20 \mathrm{~mL})$ and then added to $\mathbf{L}^{1}(5 \mathrm{mmol}, 0.6 \mathrm{~g})$ dissolved in 25 mL of dist. $\mathrm{H}_{2} \mathrm{O}$. The reaction mixtures were heated on a hot plate for 30 min . The complexes were adjusted at $\mathrm{pH}=3-4$ for $\left[\mathrm{Ni}(\mathbf{O D H}-\mathrm{H})\left(\mathrm{H}_{2} \mathrm{O}\right)_{2} \mathrm{Cl}\right]$, and at $\mathrm{pH}=4-5$ for both $\left[\mathrm{Co}_{2}(\mathbf{O D H}-2 \mathrm{H}) \mathrm{Cl}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6} \mathrm{CH}_{3} \mathrm{OH}\right] .3 \mathrm{H}_{2} \mathrm{O}$, and $\left.\left[\mathrm{Pd}_{3}(\mathrm{ODH}-\mathrm{H})_{2} \mathrm{Cl}_{4}\right]\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right] \cdot 2 \mathrm{CH}_{3} \mathrm{OH}$. The isolated products were obtained on a sintered glass Gooch (G.4); and washed with a mixture of solvents (dist. $\mathrm{H}_{2} \mathrm{O}+\mathrm{MeOH}$ ) followed by diethyl ether. On the other hand, the $\mathrm{pH}^{\prime} \mathrm{s}$ of the two complexes with the general formulae, $\left[\mathrm{Ni}_{2}(\mathrm{ODH}-\mathrm{H})(\mathrm{OH})_{2}\left(\mathrm{CH}_{3} \mathrm{OH}\right)_{2} \mathrm{H}_{2} \mathrm{O}\right] . \mathrm{H}_{2} \mathrm{O}$ and $\left[\mathrm{Co}_{2}(\mathrm{ODH}-2 \mathrm{H}) \mathrm{Cl}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6} \mathrm{CH}_{3} \mathrm{OH}\right] .3 \mathrm{H}_{2} \mathrm{O}$, were obtained at $\mathrm{pH}=2-3$. Sodium acetate was added to rise the pH in which the solid complexes were separated out. A hot solution of aqueous methanol of $\mathbf{L}^{1}(10 \mathrm{mmol}, 1.18 \mathrm{~g})$ was added to a solution of $\mathrm{PdCl}_{2}(5 \mathrm{mmol}, 0.88 \mathrm{~g})$ dissolved
in 100 mL of 3 M Conc. HCl . The mixture was kept under refluxed on a water bath for 2 h . The isolated complex was isolated in an acidic medium, where the pH was found to be 2-3. The isolated product was washed many times with hot dilute methanol; and left in an oven to dry at $120{ }^{\circ} \mathrm{C}$ for 0.5 h . All the separated compounds were kept to dry in a vacuum desiccator over anhydrous $\mathrm{CaCl}_{2}$. The data obtained are depicted in Table 1.

### 2.2.2. Physical measurement

Carbon, hydrogen, and nitrogen contents were carried out at the Microanalytical Unit (Cairo University). Mattson 5000 FTIR spectrophotometer was used to record the IR spectra of the solid complexes in the 400-4000 $\mathrm{cm}^{-1}$ range using KBr discs. The complexes in DMSO were recorded using a UV-1601 spectrophotometer in the range of (200-900 nm ). Sherwood balance was used to determine the magnetic moments at $25^{\circ} \mathrm{C}$ and the balance was adjusted using $\mathrm{Hg}\left[\mathrm{Co}(\mathrm{NSC})_{4}\right]$ as a calibrate. The results of thermal measurements (TGA and DTG) were obtained using the Schimadzu model 50 instrument. The heating rates were $20 \mathrm{~cm}^{3} / \mathrm{min}$ and $10{ }^{\circ} \mathrm{C} / \mathrm{min}$ under nitrogen flow as reported earlier [13], respectively. The metal contents and the percentage of chloride ions were determined using standard methods [14].

## 3. Results and Discussion

The complexes are insoluble in most organic solvents but the Pd (II) complex is easily soluble in DMSO. The structures of ODH complexes derived from $\mathrm{Co}(\mathrm{II}), \mathrm{Ni}(\mathrm{II})$, and $\mathrm{Pd}(\mathrm{II})$ salts were suggested on the basis of the results of physical, spectral, magnetic together with the elemental analyses listed in Table 1. All the complexes have a high melting point ( $>300{ }^{\circ} \mathrm{C}$ ) suggesting that the bond between M and L ion is very strong.

The structures of ODH and its $\mathrm{Co}(\mathrm{II})$, and $\mathrm{Ni}($ II $)$ complexes are confirmed by some physical properties and elemental analyses results as listed in Table 1. ODH shows an enormous ability to form various stereochemistry containing metal-ligand complexes of the types ( $1: 1 ; \mathrm{M}: \mathrm{L}$ ) and ( $2: 1$; $\mathrm{M}: \mathrm{L})$ as in Co , and Ni complexes. Both $\mathrm{Zn}(\mathrm{II})$, and $\mathrm{Pd}(\mathrm{II})$ complexes show the ratio ( $3: 1 ; \mathrm{M}: \mathrm{L}$ ) as shown in Table 1.

Table 1: Elemental analyses of some metal complexes.

* Compounds names are as follow:

1: ODH; 2: $\left[\mathrm{Ni}_{2}(\mathbf{O D H}-\mathrm{H})(\mathrm{OH})_{2}\left(\mathrm{CH}_{3} \mathrm{OH}\right)_{2} \mathrm{H}_{2} \mathrm{O}\right] \cdot \mathrm{H}_{2} \mathrm{O} ;$ 3: $\left[\mathrm{Ni}(\mathbf{O D H}-\mathrm{H})\left(\mathrm{H}_{2} \mathrm{O}\right)_{2} \mathrm{Cl}\right]$; 4: $\left[\mathrm{Zn}_{3}(\mathbf{O D H}-\right.$
$\left.\mathrm{H})_{2}\left(\mathrm{OCH}_{3}\right)_{2}\left(\mathrm{CH}_{3} \mathrm{OH}\right)_{2}\right] \cdot \mathrm{H}_{2} \mathrm{O} 5:\left[\mathrm{Co}(\mathrm{ODH}-\mathrm{H})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right] ;$ 6: $\left[\mathrm{Co}_{2}(\mathrm{ODH}-2 \mathrm{H}) \mathrm{Cl}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6} \mathrm{CH}_{3} \mathrm{OH}\right] \cdot 3 \mathrm{H}_{2} \mathrm{O}$; 7: $\left.\left[\mathrm{Pd}_{3}(\mathrm{ODH}-\mathrm{H})_{2} \mathrm{Cl}_{4}\right]\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right] \cdot 2 \mathrm{CH}_{3} \mathrm{OH}$

### 3.1. IR spectra

The IR spectrum of oxalic acid dihydrazide ( $\mathbf{L}^{\mathbf{1}}, \mathbf{O D H}$ ) exhibits two medium bands at 3600 and $3590 \mathrm{~cm}^{-1}$ attributed to $v(\mathrm{OH}$, free) and $v(\mathrm{OH}$, hydrogen-bonded), and three sharp bands at 3297,3200 and $3183 \mathrm{~cm}^{-1}$ assignable to $v\left(\mathrm{NH}_{2}\right.$, free $), v\left(\mathrm{NH}_{2}\right.$, hydrogen-bonded), and $v(\mathrm{NH})$ vibrations, respectively, as shown in Fig. 1. These foundations confirm that the ligand exists in tautomer (keto/enol) forms as shown in Fig. 2.

Fig. 1. Structure of $\mathbf{L}^{1}(\mathbf{O D H})$.

Fig. 2. Tautomeric forms of $\mathbf{L}^{1}(\mathbf{O D H})$.
Finally, the presence of new three splitter bands at ( $\left.1612,1559 \mathrm{~cm}^{-1}\right),\left(1540,1487 \mathrm{~cm}^{-1}\right)$,
and (1459, $1396 \mathrm{~cm}^{-1}$ ) which are assigned to $v(\mathrm{C}=\mathrm{N}$, free), and $v(\mathrm{C}=\mathrm{N}$, hydrogen-bonded), $v\left(\mathrm{CONH}_{2}\right.$, free), and $v\left(\mathrm{CONH}_{2}\right.$, hydrogenbonded), and $v(\mathrm{C}-\mathrm{OH}$, free), and $v(\mathrm{C}-\mathrm{OH}$, hydrogen-bonded) supports the existence of a tautomer form as in Fig. 2.

Different modes of chelation were suggested for the isolated metal complexes on the basis of IR, electronic spectra, and magnetic measurements. The results suggest the presence of three categories of bonding. The six complexes with the general formulae; $\left[\mathrm{Ni}_{2}(\mathrm{ODH}-\mathrm{H})(\mathrm{OH})_{2}\left(\mathrm{CH}_{3} \mathrm{OH}\right)_{2} \mathrm{H}_{2} \mathrm{O}\right] . \mathrm{H}_{2} \mathrm{O} \quad$ (2), $\left[\mathrm{Ni}(\mathbf{O D H}-\mathrm{H})\left(\mathrm{H}_{2} \mathrm{O}\right)_{2} \mathrm{Cl}\right](3),\left[\mathrm{Co}_{2}(\mathbf{O D H}-2 \mathrm{H}) \mathrm{Cl}_{2}\right.$ $\left.\left(\mathrm{H}_{2} \mathrm{O}\right)_{6} \mathrm{CH}_{3} \mathrm{OH}\right] \cdot 3 \mathrm{H}_{2} \mathrm{O}(\mathbf{6}),\left[\mathrm{Pd}_{3}(\mathbf{O D H}-\mathrm{H})_{2} \mathrm{Cl}_{4}\right]$ $\left.\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right] \cdot 2 \mathrm{CH}_{3} \mathrm{OH} \quad(7), \quad\left[\mathrm{Co}\left(\mathrm{ODH}-\mathrm{H}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]\right.$ (5), and $\left[\mathrm{Zn}_{3}(\mathbf{O D H}-\mathrm{H})_{2}\left(\mathrm{OCH}_{3}\right)_{2}\left(\mathrm{CH}_{3} \mathrm{OH}\right)_{2}\right]$. $\mathrm{H}_{2} \mathrm{O}$ (4) is proposed. The IR spectra of the former three complexes show that the ligand coordinates via the NH and the enolized carbonyl oxygen with the removal of a proton from the enolized carbonyl oxygen (-C-OH) group forming a five-membered ring around the metal ions. is attributed to The $v(\mathrm{~N}-\mathrm{N})$ vibration is observed at $1101 \mathrm{~cm}^{-1}$ in the uncoordinated ligand (ODH). This band is shifted and observed in 1173-1208 $\mathrm{cm}^{-1}$ region indicating that the ligand coordinates via either the NH or $\mathrm{NH}_{2}$ groups. Doubtless the large shifts of the $v(\mathrm{~N}-\mathrm{N})$ vibration that exists in the hydrazine complexes is traced in the complexes behave in a bidentate hydrazine [15]. Both the $\beta\left(\mathrm{NH}_{2}\right)$ and $\delta\left(\mathrm{NH}_{2}\right)$ vibrations in the free ligand are
observed at 1632,1321 , and $1159 \mathrm{~cm}^{-1}$ which are shifted in the complexes and observed in 1547-1581, 1306-1316, and 1173-1208 $\mathrm{cm}^{-1}$ region, respectively. All these foundations suggest that the NH group is taking part in coordination. The band at $1005 \mathrm{~cm}^{-1}$ is assigned to $\delta(\mathrm{NH})$ vibration [16], however this band is not observed in the spectra of the complexes. Both the two bands at 1045 and $920 \mathrm{~cm}^{-1} 1632$, 1321 , and $1159 \mathrm{~cm}^{-1}$ assigned to $v_{\mathrm{as}}(-\mathrm{C}-\mathrm{O})$ and $v_{\mathrm{s}}(-\mathrm{C}-\mathrm{O}-)$ vibrations, respectively, are observed in the metal complexes.

### 3.2. Electronic spectra, and magnetic measurements

The electronic spectra of the metal chelates were executed in DMSO and some in Nujol $\left(\mathrm{Ni}^{2+}\right.$ complexes). The $\mathrm{Ni}^{2+}$ complex with the general formula, $\left[\mathrm{Ni}_{2}(\mathbf{O D H}-\mathrm{H})(\mathrm{OH})_{2}\left(\mathrm{CH}_{3} \mathrm{OH}\right)_{2}\right.$ $\left.\mathrm{H}_{2} \mathrm{O}\right] . \mathrm{H}_{2} \mathrm{O}$, displays three bands at 10204, 14835, and $21314 \mathrm{~cm}^{-1}$ in Nujol mull assigned to ${ }^{3} \boldsymbol{A}_{2 g} \rightarrow{ }^{3} \boldsymbol{T}_{2 g}\left(\boldsymbol{v}_{1}\right),{ }^{3} \boldsymbol{A}_{2 g} \rightarrow{ }^{3} \boldsymbol{T}_{1 g}$ (F) $\left(\boldsymbol{v}_{2}\right)$, and ${ }^{3} \boldsymbol{A}_{2 g}$ $\rightarrow{ }^{3} \boldsymbol{T}_{1 g}(\mathrm{P})\left(\boldsymbol{v}_{3}\right)$ [17], respectively. The bands at 31603 and 25450 are attributed to $\boldsymbol{L} \rightarrow \boldsymbol{M}$ (LMCT). Also, the values of $v_{2} / v_{1}$ (1.49) together with the value of $\boldsymbol{\mu}_{\text {eff }}(3.1 \mathrm{BM})$ support the presence of octahedral geometry around the $\mathrm{Ni}($ II ) ion as shown in Fig. 3.

On the other hand, the electronic spectrum of the second $\mathrm{Ni}(\mathrm{II})$ complex with the general formula, $\left[\mathrm{Ni}(\mathbf{O D H}-\mathrm{H})\left(\mathrm{H}_{2} \mathrm{O}\right)_{2} \mathrm{Cl}\right.$,] was carried out in Nujol mull. The three bands at 10141, 14815 , and $25316 \mathrm{~cm}^{-1}$ assigned to ${ }^{3} \boldsymbol{B}_{I} \rightarrow{ }^{3} \boldsymbol{B}_{2}$, ${ }^{3} \boldsymbol{B}_{I} \rightarrow{ }^{3} \boldsymbol{A}_{2}$, and ${ }^{3} \boldsymbol{B}_{I} \rightarrow{ }^{3} \boldsymbol{A}_{2},{ }^{3} \boldsymbol{E}(\boldsymbol{P})$ transitions, respectively, suggest a square-pyramidal geometry (Fig. 4) around the $\mathrm{Ni}^{2+}$ ion [18]. Another strong evidence for the presence of a square-pyramidal structure around the $\mathrm{Ni}(\mathrm{II})$ ion comes from the value of magnetic moment (3.54 BM).

Fig. 3: Structure of $\left[\mathrm{Ni}_{2}(\mathbf{O D H}-\right.$ $\left.\mathrm{H})(\mathrm{OH})_{2}\left(\mathrm{CH}_{3} \mathrm{OH}\right)_{2} \mathrm{H}_{2} \mathrm{O}\right] . \mathrm{H}_{2} \mathrm{O}$.

Fig. 4: Structure of $\left[\mathrm{Ni}(\mathbf{O D H}-\mathrm{H})\left(\mathrm{H}_{2} \mathrm{O}\right)_{2} \mathrm{Cl}\right]$.
Both the spectra of the two $\mathrm{Co}^{2+}$ complexes, $\left[\mathrm{Co}_{2}(\mathrm{ODH}-2 \mathrm{H}) \mathrm{Cl}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\left(\mathrm{CH}_{3} \mathrm{OH}\right)\right] \cdot 3 \mathrm{H}_{2} \mathrm{O}$, and $\left[\mathrm{Co}(\mathrm{ODH}-\mathrm{H})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]$, were carried out in DMSO. The first Co(II) complex shows two bands at 18819 and $9570 \mathrm{~cm}^{-1}$ which are assigned to ${ }^{4} \boldsymbol{T}_{1 g} \rightarrow{ }^{4} \boldsymbol{T}_{g} \mathrm{P}\left(\boldsymbol{v}_{3}\right)$ transition. The $\boldsymbol{v}_{2}$ band was calculated and found to be $5560 \mathrm{~cm}^{-1}$ attributed to ${ }^{4} \boldsymbol{T}_{1 g} \rightarrow{ }^{4} \boldsymbol{A}_{2 g}$ transition and hence the value of $\boldsymbol{v}_{3} / \boldsymbol{v}_{2}$ equals 2.69 . The results of the electronic spectrum together with the magnetic moment ( 5.56 BM ) suggest the existence of an octahedral geometry around the first $\mathrm{Co}(\mathrm{II})$ ions as shown in Fig. 5.

The second $\mathrm{Co}^{2+}$ complex, $\left[\mathrm{Co}(\mathbf{O D H}-\mathrm{H})_{2}\right.$ $\left.\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]$, exhibits a band at $14970 \mathrm{~cm}^{-1}$ assigned to ${ }^{4} \boldsymbol{T}_{1 g} \rightarrow{ }^{4} \boldsymbol{T}_{g} \mathrm{P}\left(\boldsymbol{v}_{3}\right)$ transition while the $\boldsymbol{v}_{2}$ was calculated and found to be $5560 \mathrm{~cm}^{-1}$ attributed to ${ }^{4} \boldsymbol{T}_{1 g} \rightarrow{ }^{4} \boldsymbol{A}_{2 g}$ transition and hence the value of $v_{3} / \boldsymbol{v}_{2}$ equals 1.96 . The results of the magnetic moment ( 3.87 BM ) as well as the values of the electronic spectrum suggests the presence of an octahedral geometry around the second $\operatorname{Co}($ II $)$ ion as shown in Fig. 6.

The low value of magnetic moment (3.87 BM ) is explained on the basis of the existence of metal-metal bond.

Fig. 5. Structure of $\left[\mathrm{Co}_{2}(\mathbf{O D H}-2 \mathrm{H}) \mathrm{Cl}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right.$ $\left.\left(\mathrm{CH}_{3} \mathrm{OH}\right)\right] .3 \mathrm{H}_{2} \mathrm{O}$.

Fig. 6. Structure of $\left[\mathrm{Co}(\mathbf{O D H}-\mathrm{H})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]$.
The spectrum of diamagnetic $\mathrm{Pd}^{2+}$ complex, $\left.\left[\mathrm{Pd}_{3}(\mathrm{ODH}-2 \mathrm{H}) \mathrm{Cl}_{4}\right]\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right] \cdot 2 \mathrm{CH}_{3} \mathrm{OH}$, shows two bands at 26323 , and $31906 \mathrm{~cm}^{-1}$ assigned to
$\pi \rightarrow \pi^{*}(M \rightarrow L)$, and $\pi \rightarrow \pi^{*}(L \rightarrow M)$ transitions [19, 20], respectively. The spectrum as well as the diamagnetic behavior suggests structure Fig. 7.

Fig. 7. Structure of $\left[\mathrm{Pd}_{3}(\mathbf{O D H}-\right.$ $\left.\left.2 \mathrm{H}) \mathrm{Cl}_{4}\right]\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right] .2 \mathrm{CH}_{3} \mathrm{OH}$

* Compounds names are as follow:

2: $\left[\mathrm{Ni}_{2}(\mathbf{O D H}-\mathrm{H})(\mathrm{OH})_{2}\left(\mathrm{CH}_{3} \mathrm{OH}\right)_{2} \mathrm{H}_{2} \mathrm{O}\right] \cdot \mathrm{H}_{2} \mathrm{O} ;$ 3: $\left[\mathrm{Ni}(\mathbf{O D H}-\mathrm{H})\left(\mathrm{H}_{2} \mathrm{O}\right)_{2} \mathrm{Cl}\right] ;$ 5: $\left[\mathrm{Co}(\mathbf{O D H}-\mathrm{H})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]$;
6: $\left[\mathrm{Co}_{2}(\mathrm{ODH}-2 \mathrm{H}) \mathrm{Cl}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6} \mathrm{CH}_{3} \mathrm{OH}\right] \cdot 3 \mathrm{H}_{2} \mathrm{O} ; 7$ : $\left.\left[\mathrm{Pd}_{3}(\mathrm{ODH}-\mathrm{H})_{2} \mathrm{Cl}_{4}\right]\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right] \cdot 2 \mathrm{CH}_{3} \mathrm{OH}$
**: per one metal atom

## Conclusion:

Six complexes derived from OXD $\left(\mathbf{L}^{\mathbf{1}}\right)$ were synthesized and characterized by chemical, spectral, and magnetic measurements. The IR spectra suggest that the ligand acts in a bidentate manner through the enolized carbonyl oxygen and the NH groups with the removal of a proton from the former group. Also, it acts as a bidentate ligand coordinated via the azomethine ( $\mathrm{C}=\mathrm{N}$ ) and the enolized carbonyl oxygen with the removal of a proton from the latter group forming a five-membered ring around the $\mathrm{Co}^{2+}$ ion. Finally, two ligands bonded three $\mathrm{Pd}^{2+}$ ions in which the terminal two palladium ions are bonded through the carbonyl oxygen and the azomethine groups forming two five-membered rings around the $\mathrm{Pd}^{2+}$ ions, while the intermediate $\mathrm{Pd}^{2+}$ ion is
coordinated to two NH and two enolized carbonyl oxygen with the removal of two protons forming two five-membered rings around the $\mathrm{Pd}^{2+}$ ion. The geometries of the complexes were determined depending on the spectral and magnetic measurements. The amounts of solvents either inside or outside the coordination sphere were determined using the weight loss and TGA methods.
