

a-Mucous cell

b- Nematocyst

- Food vacuole

Put (✓) or (x):

15 marks

- 1-Platyhelminthes are acoelomate animals.
- 2- Some Chordata use flagella for movement.
- 3- Excretory system of molluscs is the mantle.
- 4- Mouth of coelenterates used for feeding only.
- 5- Nematocysts are used only for food capture.
- 6- Excretion in Protozoa is by simple diffusion.
- 7- Platyhelminthes are mostly hermaphrodites.
- 8- The characterized cell of sponges is choanocytes.
- 9- Nematodes are pseudocoelomate animals.
- 10-Annelids have two layers of muscles.
- 11-Arthropods move by legs.
- 12-Skeleton in molluscs is composed of shell.
- 13-Protozoa respiration is by body surface.
- 14-Coelenterates are free swimming only.
- 15-Nematodes are characterized by absence of cilia.
- 16-Nematodes are characterized by absence of cilia.
- 17-The protoplasm of protozoa is differentiated into ectoplasm and endoderm.
- 18-The nervous system of porifera consist of one or more network.
- 19-Molluscan animals are filter feeders only.
- 20-The excretion of Aschelminthes is by Renettes.
- 21-The body of chordate animals covered by feathers or hair.
- 22-The gut of Platyhelminthes has mouth only.
- 23- The circulatory system of annelida is closed.
- 24-Body of Mammals covered by scales.
- 25-The genital opening and anus open in the mantle cavity of .
- 26-Vertebrate animals have complete digestive system with accessory glands.
- 27- The body of porifera is perforated by numerous ostia.
- 28- Annelids are segmented animals with jointed appendages.
- 29-Asexual reproduction of protozoa is by binary and multiple fission.
- 30-Chordata are triploblastic acoelomate animals.

With our best wishes.
