## Note: Assume any data required, state your assumption clearly.

## Question (1)

(25 Marks)

1. a ) Drive an expression for head rise coefficient due to lateral outlet and discuss how it changes with $Q_{3} / Q_{1}$
1.b) all pipes are 8 -cm-diameter cast iron $(\varepsilon=0.26 \mathrm{~mm})$. Determine the water $\left(\mu=1.307 \times 10^{-3} \mathrm{Pa.s}, \rho=1000\right.$ $\mathrm{kg} / \mathrm{m}^{3}$ ) flow rate from reservoir 1 if valve C is
(a) closed and (b) open, $\mathrm{k}=0.5$ based on $h_{l}=k v^{2} / 2 g$.

## Question (2)

## (25 Marks)

2.a) In manifold flow, drive an expression for orifice coefficient and show the effect of lateral length on this coefficient.
2.b) The 3-port manifold shown in the next diagram has a port-to-main diameter ratio $D_{3} / D_{1}=0.4$, a friction factor $f=0.02$ in the main and all laterals, and $L_{3} D_{3}=4$ for each lateral. Considering fluid friction in the main and laterals and junction losses, compute the port discharges $Q_{a}, Q_{b}$, and $Q_{c}$. The downstream end of the main is closed off by a blank plate

## Question (3)

In the sketch the network consists of 6 pipes and 3 nodes. A source pump and one reservoir supply the netw and the reservoir connected to pipe 5 receives water. Do the following tasks: (a) write the system o: equations; (b) write the system of $\Delta \mathrm{Q}$-equations; (c) using the Newton method, describe the solution of system of $\Delta Q$-equations; (d) if the discharge in pipe 1 is $\mathrm{Q}_{1}=0.08 \mathrm{~m}^{3} / \mathrm{s}$ from the reservoir , the discharo pipe 5 is $\mathrm{Q}_{5}=0.06 \mathrm{~m}^{3} / \mathrm{s}$ into the reservoir, and the discharge in pipe 6 is $\mathrm{Q}_{6}=0.14 \mathrm{~m}^{3} / \mathrm{s}$ from the reser what are discharges at other pipes and the demand at each junction? Take the friction factor to be 0.02 and, 35-600Q $Q^{2}$.

| Pipe | Bia <br> ma | Length <br> m |
| :--- | :---: | :---: |
| 1 | 0.30 | 1000 |
| 2 | 0.20 | 2500 |
| 3 | 0.20 | 1000 |
| 4 | 0.30 | 1500 |
| 5 | 0.15 | 1000 |
| 6 | 0.35 | 800 |

## Question (4)

( 25 Marks)
A 675 mm water main runs horizontally for 1500 m and then branches into two 450 mm mains $\mathrm{e}_{\text {i }}$ 3000 m long. In one of these branches the whole water entering is drawn off at a uniform rate alc the length of the pipe; assume atmospheric pressure at the end of that branch. In the other brar one-half of the quantity entering is drawn off through five ports at 750 m intervals and remainder discharged to a tank downstream. If the friction factor equals 0.02 . Calculate the fl rate entering each branch, the diameter of each port and the water level in the downstream te when the inflow to the system is $0.28 \mathrm{~m}^{3} / \mathrm{sec}$ and the upstream pressure head is 300 m wat Consider only frictional losses and equal discharge at each port. Calculate the diameters $o_{\text {, . .e }} \mathrm{f}$ ports.
