(Received: 16/ 2 / 2013)

#### Abstract

4-Arylidene-3-methyl-1-phenyl-5-pyrazolones 2ac were treated with phenols such as resorcinol, phloroglucinol, pyrogallol, 8-hydroxyquinoline, orcinol, 2-naphthol and 1,5 -dihydroxynaphthalene to give a series of phenolic compounds incorporating pyrazole moiety or 1,4-dihydrochromeno[2,3-c]pyrazole derivatives, depending on the reaction conditions. In addition, compounds 2a and 2c were subjected to Mannich reaction to give the phenolic bases 20-22 and bis-bases 24a and 24b. The newly synthesized compounds were screened for their antioxidant activity and Bleomycinedependent DNA damage assay.

Key words: phenolic compounds, pyrazoles, antioxidant activity

## INTRODUCTION

A variety of compounds having a 5-pyrazolone moiety as a structural unit have been synthesized and studied with interest centered on their potential pharmaceutical activity. The literature survey reveals that the pyrazolone moiety is an important pharmacophore (Mariappan, et al., 2010) and exhibits outstanding biological activities such as, antibacterial, antifungal (Al-Haiza, et al., 2001), anti-inflammatory (Mariappan, et. al., 2010 and Badawey, et al., 1998), analgesic (Mohd \& Kumar, 2005; and Gursoy, et al., 2000), antitubercular (Joshi et
al., 2007, Castagnolo, et al., 2009), antioxidant (Kumar, et al., 2008) and anticancer (Sunil, et al., 2009) activities.

On the other hand, phenolic compounds are important pharmacophores in the medicinal and pharmaceutical fields. Phenolic compounds (e.g. phenolic acids, flavonoids, coumarins and tannins) possess a potential antioxidant activity (Larson, 1988; Cotelle, et al., 1996; Velioglu, et al., 1998; Zheng \& Wang 2001 and Cai, et al., 2004), and many of these compounds possess anti-inflammatory, antiatherosclerotic, antitumor, antimutagenic, anticarcinogenic, antibacterial or antiviral activities (Owen, et al., 2000 and Sala, et al., 2002).

From the view point of molecular design, the combination of two biologically active molecules or pharmacophores is a well-known approach for the build-up of drug-like molecules, which allows us to find more potent agents. The present study deals with the synthesis of some phenolic compounds incorporating pyrazole moiety, starting from 4-arylidene-3-methyl-1-phenyl-5-pyrazolones 2a-c as key starting compounds. The new products might possess considerable synthetic and pharmaceutical interest.

## RESULTS AND DISCUSSION

In the present study, 4-arylidene-3-methyl-1-phenyl-5pyrazolones 2a-c were prepared by treating 3-methyl-1-phenyl-5pyrazolone (1) with the appropriate aldehyde as previously described (Sawedy, et al., 1950; Afsah, et al., 1980 and Amal \& Kapuano 1951). The reaction of oxalyl-1,1'-bis(3-methyl-2-pyrazolin-5-one) (3) (Ram \& Pandey, 1975) with $p$-anisaldehyde gave the bis[4-(4methoxybenzylidene)] derivative 4 , which is insoluble in most organic solvents.

Treatment of 2a with dihydric or trihydric phenols such as resorcinol, phloroglucinol and pyrogallol afforded the corresponding phenolic compounds 5, 6 and 7, respectively. In addition, the alternative synthesis of compounds 5-7 by one-pot, four-component sequential reaction of 5-pyrazolone (1), $p$-anisaldehyde and the appropriate phenol, confirmed their structures (route b). The formation of 5-7 via route (b), is in line with a recent report (Gunasekaran, et al., 2011) on the reaction of 1 with aromatic aldehydes and $\beta$-naphthol to give 4-[(2-hydroxy-1naphthyl)arylmethyl]pyrazoles.

The intermediacy of the 4-(4-methoxybenzylidene) derivative 2a in this sequential reaction is evident from the formation of 5-7 via route (a). According to previous studies (Gunasekaran, et al., 2011; Elguero, et al., 1976; Hwang, et al., 1993; Alderete, et al., 2000;Belmar;et al., 2001 and Belmar;et al., 1999) pyrazolones could exist in three tautomeric forms, viz. the $\mathrm{CH}, \mathrm{OH}$ and NH forms (Fig. 1). The tautomers between the OH and CH forms have been reported to exist in solution and even in crystals (Elguero, et al., 1976).

5-7

Scheme 1

Fig. 1. Tautomeric forms of pyrazolones (5-7)

The IR spectral data of compounds 5, 6 and 7 showed absorption bands at 1602-1606 ( $\mathrm{C}=\mathrm{N}$ ) and $3400-3445 \mathrm{~cm}^{-1}$ due to $(\mathrm{OH})$, and no absorption attributed to $(\mathrm{C}=\mathrm{O})$ group, indicating that compounds 5-7 exist as a 5-hydroxypyrazole form (A). The main characteristic features of the ${ }^{1} \mathrm{H}$ NMR spectrum of 7 as an example, are a singlet at $\delta=5.94$ assignable to $(\mathrm{CH})$, three singlets at 5.72 , 5.59 and $5.19(3 \mathrm{x} \mathrm{OH})$, a broad singlet at 7.54 (enolic OH ), two singlets at $3.69\left(\mathrm{OCH}_{3}\right)$ and 2.48 $\left(\mathrm{CH}_{3}\right)$. The mass spectra of 5-7 showed very similar cleavage patterns. Cleavage at the branched carbon atom with elimination of phenolic ion leads to the base peak at $m / z=110$ due to resorcinol ion (for 5), 292 [Mphloroglucinol ion] (for 6) and a very intense peak at $m / z=126$ (94\%) due to pyrogallol ion (for 7), as depicted in Scheme 2.

Scheme 2

This reaction with phenols has been extended to 4-(4-hydroxybenzylidene)-3-methyl-1-phenyl-5-pyrazolone (2b) and the 4-(4-hydroxy-3-methoxybenzylidene) analog (2c), thus enabling the formation of di-phenolic compounds through a Michael type reaction. Therefore,
the synthesis of 4-[(2,4-dihydroxyphenyl)(4-hydroxyphenyl)methyl]-3-methyl-1-phenyl-1H-pyrazol-5-ol (8a) and the 4-(4-hydroxy-3methoxyphenyl) analog ( $\mathbf{8 b}$ ) has been achieved by the reaction of resorcinol with $\mathbf{2 b}$ and $2 \mathbf{c}$, respectively. A similar reaction takes place on treating 2b and 2c with pyrogallol and 8-hydroxyquinoline, yielding compounds $9 \mathbf{a}-\mathbf{b}$ and 10a-b. In addition, treatment of $\mathbf{8 b}$ with dimethyl sulfate afforded 4-[(2,4-dimethoxyphenyl)(3,4-dimethoxyphenyl)methyl]-3-methyl-1-phenyl-1 H --pyrazol-5-ol (Scheme 3).

In line with this, 4-[(2,4-dihydroxy-6-methylphenyl)(4-hydroxy-3-methoxyphenyl)methyl]-3-methyl-1-phenyl-1 $H$-pyrazol-5-ol (12) and the (2-hydroxynaphthalen-1-yl)methyl analog (13) were obtained by treating 2c with orcinol and 2-naphthol, respectively. The mass, IR and ${ }^{1} \mathrm{H}$ NMR spectral data of compounds $\mathbf{8 - 1 3}$ are consistent with their structures.

On the other hand, the one-pot, three-component sequential reaction of 5-pyrazolone (1), p-hydroxybenzaldehyde and/or vanillin with resorcinol in acidic medium proceeded smoothly to give 4-(4-hydroxyphenyl)-3-methyl-1-phenyl-1,4-dihydrochromeno[2,3-c]pyrazol-7-ol (14a) and the 4-(4-hydroxy-3-methoxyphenyl) analog (14b), respectively. A similar reaction takes place on using pyrogallol, yielding 4-(4-hydroxyphenyl)-3-methyl-1-phenyl-1,4-dihydrochromeno[2,3-c]pyrazole-7,8-diol (15a) and the 4-(4-hydroxy-3-methoxyphenyl) analog (15b) (Scheme 4). The formation of compounds $\mathbf{1 4 a}, \mathbf{b}$ and $15 a, \mathbf{b}$ is in line with the reported synthesis of benzochromeno-pyrazoles via reaction of aldehydes with 1 and $\alpha$ - or $\beta$-naphthol (Heravi, et al., 2011). The ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{1 5 b}$, as an example, revealed a singlet at $\delta=6.07$ assignable to $(4-\mathrm{H})$, three singlets at $6.04,5.56$ and $5.54(3 \mathrm{x} \mathrm{OH})$, two singlets at $3.42\left(\mathrm{OCH}_{3}\right)$ and $2.49\left(\mathrm{CH}_{3}\right)$. The mass spectra of $\mathbf{1 4 a} \mathbf{a} \mathbf{b}$ and 15a,b contain peaks of the respective molecular ions, and fragmentation patterns which supported their structures.

9b: $\mathrm{R}=\mathrm{OMe}$
10b: $\mathrm{R}=\mathrm{OMe}$

2c
.

Scheme 3

Scheme 4

The scope of the above reaction has been broadened by treatment of 2a and 2c with 1,5-dihydroxynaphthalene (16) in acidic medium to give $\quad 7 H$-(7-p-anisyl)-8-methyl-10-phenyl-pyrazolo[5,4-b]benzo[h] chromen-4-ol (17a) and the 7-(4-hydroxyl-3-methoxyphenyl) analog (17b), respectively. Whereas, the reaction of 2a-c with 16 in a molar ratio of $2: 1$ afforded 18a-c, respectively, rather than the expected polycyclic compounds 19a-c, as confirmed by analytical and spectral data.

A variety of compounds having a phenolic Mannich base as a structural unit have been synthesized and studied with interest centered on their potential pharmaceutical activity. In particular, a number of phenolic Mannich bases and bis(Mannich bases) related to chalcones have demonstrated significant cytotoxicity and anticancer properties (Gul, et al., 2008; Reddy, et al., 2008 and Saydam, et al., 2003 ).

In view of this, the Mannich reaction of the phenolic moiety of compounds $2 \mathbf{b}$ and $\mathbf{2 c}$ is of particular interest, because it provides access to 4-arylidene-3-methyl-1-phenyl-5-pyrazolones possessing a phenolic Mannich base as a structural unit. This has been realized by treating 2b with piperidine and formaldehyde to give 4-[4-hydroxy-3-(piperidin-1-ylmethyl)benzylidene]-3-methyl-1-phenyl-5-pyrazolone (20). The analogous reaction of 2 c with dimethylamine and morpholine gave the phenolic Mannich bases 21 and 22, respectively (Scheme 6).

Scheme 5

Scheme 6

The mass spectra of compounds 20,21 and 22 contain peaks of the respective molecular ions, and fragmentation patterns which supported their structures. The mass spectrum of 20, as an example, revealed a molecular ion peak at $m / z=377[\mathrm{M}+2]^{+}$, the basic side chain can be identified by two peaks at $m / z=85(41 \%)$ and $97(22 \%)$ due to $N-$ piperidinomethyl ion, which undergo further fragmentation to give the base peak at $m / z=57(100 \%)$, as depicted in Scheme 7.

Scheme 7

In connection with this study, the reaction of compounds 2a and $\mathbf{2 b}$ with 4,4'-trimethylenedipiperidine (23) was investigated as a route to bis-(Mannich bases) of the type 24 having two pyrazolone units. This has been achieved by treating 2a and $\mathbf{2 b}$ with 23 to give $\mathrm{N}, \mathrm{N}$ '-di( $4-$ methoxyphenyl-3-methyl-1-phenyl-5-pyrazolone-4-ylmethyl)-4,4"trimethylenedipiperidine (24a) and the $\mathrm{N}, \mathrm{N}$ '-di(4-hydroxyphenyl-3-methyl-1-phenyl-5-pyrazolone-4-ylmethyl) analog (24b), respectively
(Scheme 8). The analytical, IR, ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR and mass spectral data are consistent with the structures proposed for compounds $\mathbf{2 4 a}$ and $\mathbf{2 4 b}$.

Scheme 8

## Biological Activity

Table (1): ABTS Antioxidant activity assay

## ABTS Antioxidant assay

The antioxidant activity of the synthesized compounds was evaluated by the ABTS method (El-Gazzar, et al., 2009). The obtained data (Table 1) showed that:
a. Compounds $\mathbf{7}$ and $\mathbf{1 5 b}$ proved to exhibit the highest activity
b. Compounds 14a, 15a and 18b showed a moderate antioxidant activity.
c. The rest of the tested compounds revealed weak activity.

The presence of 5-pyrazolone moiety implies its importance in the antioxidant effect.
The structure activity relationship (SAR) of the tested compounds indicate that the presence of methoxy group increased the antioxidant activity. The antioxidant activity increased with the introduction of one methoxy group and three hydroxyl groups as shown in 7 in addition to the presence of chromene group in $\mathbf{1 5 b}$.
Compound 7 possessed the best substitution on the pyrazole ring causing high antioxidant activity which was the 2,3,4-trihydroxyphenyl group.
For compound 15b having the dihydrochromene pyrazole moiety the best substitution causing high antioxidant activity was 4 -hydroxy-3-methoxy groups at the phenolic moiety

Compounds 4, 6, 7, 8a, 8b, 13, 14a, 14b, 15a, 15b, 17a, 17b, 18a, 18b, 18c, 20, 21 and 24a were selected to test for Bleomycindependent DNA damage (Table 2). Damage to DNA in the presence of Bleomycin-Fe complex has been adopted as a sensitive and specific method to examine potential pro-oxidant agents (Gutteridge, et al., 1981). If the samples to be tested are able to reduce the Bleomycin- $\mathrm{Fe}^{3+}$ to Bleomycin- $\mathrm{Fe}^{2+}$, DNA degradation in this system will be stimulated, resulting in a positive test for pro-oxidant activity. L-Ascorbic acid can reduce $\mathrm{Fe}^{3+}$ to $\mathrm{Fe}^{2+}$ as a reducing agent.

Table 2 shows that compounds 4, 7, 8a, 13, 14a, 14b, 15a, 17a, 17b, 18b, 20 and 21 have an ability to protect DNA from the induced damage by bleomycin. From the structure activity relationship (SAR), it is noteworthy that compounds $4,7,8 a, 13,14 a, 14 b, 15 a, 17 a, 17 b, 18 b$, 20 and 21 have $\mathrm{OMe}, \mathrm{OH},(\mathrm{Me})_{2} \mathrm{NH}$ and piperidine groups attached to aromatic ring which is effective in protecting DNA damage from Bleomycin.

Table (2): Bleomycin-dependent DNA damage activity

| Compound <br> No. | Bleomycine-dependent DNA <br> Absorbance of samples |
| :---: | :---: |
|  | $0.0038 \pm 0.01$ |
| $\mathbf{4}$ | $0.017 \pm 0.05$ |
| $\mathbf{6}$ | $0.080 \pm 0.22$ |

## Lymphocyte transformation assay

The lymphocyte transformation (mitogensis) or proliferation assay was used to assess the immnunomodulating activity of compounds 4, 7, 8a, 13, 14a, 14b, 15a, 17a, 17b, 18b, 20 and 21. The cell-mediated immune response was determined in the peripheral blood lymphocytes (PBL) in response to mitogenic stimulation using either phytohaemagglutinin (PHA) or concanavalin A (Con A) as mitogens that stimulate human T and B cells but T-cells more vigorously. Table 3 shows that compounds 7, 15b, 20 and 21 have the highest ability for transformation (proliferated) blasts.

## CONCLUSION

The newly prepared compounds showed interesting biological activities. Compound 7 exhibited a high antioxidant activity and best protective effect against DNA damage induced by bleomycin.

## Experimental Section

All melting points (uncorrected) were determined on a Gallenkamp electric melting point apparatus. Elemental microanalyses were carried out at Microanalytical Unit, Mansoura University. Infrared spectra were measured on a Mattson 5000 FTIR spectrometer. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR data were obtained in $\mathrm{CDCl}_{3}$ or $\left[\mathrm{D}_{6}\right]$ DMSO solution on a Varian XL 200 MHz instrument using TMS as internal standard. Chemical shifts are reported in $\mathrm{ppm}(\delta)$ downfield from internal TMS. Mass spectra were recorded on a GC-MS QP - 1000 EX Shimadzu instrument. The course of the reaction and the purity of the synthesized compounds were monitored by TLC using EM science silica gel coated plates with visualization by irradiation with ultraviolet lamp.

## 1,2-Bis[4-(4-methoxybenzylidene)-3-methyl-5-oxo-4,5-dihydro-1H-pyrazol-1-yl]ethane-1,2-dione (4)

A mixture of $3(2.5 \mathrm{~g}, 0.01 \mathrm{~mol})$ and $p$-anisaldehyde $(2.36 \mathrm{~g}, 0.02$ mol ) was heated at $125{ }^{\circ} \mathrm{C}$ (oil bath) for 40 min . The product that was obtained on cooling was washed with boiling ethanol to give 4. M. p. $320^{\circ} \mathrm{C}$. Yield $75 \%$ (white powder). - IR (KBr): $v=1660,1607,1500$, 1442, 1319, 1242, $1118 \mathrm{~cm}^{-1} .-$ MS (EI, 70 eV ): m/z (\%) = 487 (23) $[\mathrm{M}+1]^{+}, 437$ (19), 370 (23), 200 (19), 177 (19), 151 (23), 109 (23), 105 (38), 90 (73), 77 (39), 57 (100). - $\mathrm{C}_{24} \mathrm{H}_{22} \mathrm{~N}_{4} \mathrm{O}_{6}$ (486.48): Calcd. C 64.19, H 4.56, N 11.52; found C 64.01, H 4.36, N 11.32 .

## 4-[Aryl(4-methoxyphenyl)methyl]-3-methyl-1-phenyl-1H-pyrazol-5ols (5-7)

Procedure (a): A solution of $2 \mathrm{a}(2.92 \mathrm{~g}, 0.01 \mathrm{~mol})$ and resorcinol or phloroglucinol or pyrogallol $(0.01 \mathrm{~mol})$ in absolute ethanol $(50 \mathrm{~mL})$ was refluxed for 6 h . The product that was obtained on cooling was filtered and washed with boiling ethanol to give 5-7.

Procedure (b): A solution of $1(1.74 \mathrm{~g}, 0.01 \mathrm{~mol}), p$-anisaldehyde $(1.18 \mathrm{~g}, 0.01 \mathrm{~mol})$ and the appropriate phenol $(0.01 \mathrm{~mol})$ in acetic acid $(30 \mathrm{~mL})$ was refluxed for 6 h . The product that was obtained was filtered
and washed with boiling ethanol to give 5-7. Yield 60,52 and $55 \%$, respectively. The structure was confirmed by a comparison of IR data, mp . and TLC with that from Procedure (a).

## 4-[(2,4-Dihydroxyphenyl)(4-methoxyphenyl)methyl]-3-methyl-1-phenyl-1H-pyrazol-5-ol (5)

M. p: $175^{\circ} \mathrm{C}$. Yield $60 \%$ (buff powder). - IR (KBr): $v=3418$ (OH), $1600(\mathrm{C}=\mathrm{N}), 1500,1460,1247,1176,1028,758 \mathrm{~cm}^{-1} .-$ MS (EI, $70 \mathrm{eV}): \mathrm{m} / \mathrm{z}(\%)=229$ (36) [M-pyrazolol ion] ${ }^{+}$, 230 (38), 159 (8) [pyrazolol ion-Me] ${ }^{+}, 110$ (100) [resorcinol ion $+\mathrm{H}^{+}, 109$ (30), 108 (47), 77 (43) $[\mathrm{Ph}]^{+} .-\mathrm{C}_{24} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{O}_{4}$ (402.44): Calcd. C 71.63, H 5.51, N 6.96; found C 71.52, H 5.43, N 6.81 .

## 4-[(4-Methoxyphenyl)(2,4,6-trihydroxyphenyl)methyl]-3-methyl-1-phenyl-1H-pyrazol-5-ol (6)

M. p: $188-190^{\circ} \mathrm{C}$. Yield $52 \%$ (buff powder). - IR (KBr): $v=$ $3444(\mathrm{OH}), 1605(\mathrm{C}=\mathrm{N}), 1500,1459,1247,1274,1013,755 \mathrm{~cm}^{-1} .-\mathrm{MS}$ (EI, 70 eV ): m/z (\%) = 420 (1) $[\mathrm{M}+2]^{+}, 293$ (21) [M-phloroglucinol ion $]^{+}$, 292 (100) [M-(phloroglucinol ion +H ) ${ }^{+}$, 245 (3) [M-pyrazolol ion $]^{+}, 173$ (14) [pyrazolol ion] ${ }^{+}, 126$ (12) [phloroglucinol ion +H$]^{+}, 77$ (78) $[\mathrm{Ph}]^{+} .-\mathrm{C}_{24} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{O}_{5}$ (418.44): Calcd. C 68.89, H 5.30, N 6.69; found C 68.77, H 5.21, N 6.55 .

## 4-[(4-Methoxyphenyl)(2,3,4-trihydroxyphenyl)methyl]-3-methyl-1-phenyl-1H-pyrazol-5-ol (7)

M. p: $190-192^{\circ} \mathrm{C}$. Yield $55 \%$ (buff powder). - IR (KBr): $v=$ $3444(\mathrm{OH}), 1604(\mathrm{C}=\mathrm{N}), 1500,1458,1247,1176,1030,755 \mathrm{~cm}^{-1} .-{ }^{1} \mathrm{H}$ NMR (300 MHz, [D ${ }_{6}$ ] DMSO, $25^{\circ} \mathrm{C}$, TMS): $\delta=2.48$ (s, 3H, CH3), 3.69 $\left(\mathrm{s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right), 5.19(\mathrm{~s}, 1 \mathrm{H}, \mathrm{OH}), 5.59(\mathrm{~s}, 1 \mathrm{H}, \mathrm{OH}), 5.72(\mathrm{~s}, 1 \mathrm{H}, \mathrm{OH})$, $5.94(\mathrm{~s}, 1 \mathrm{H}, \mathrm{CH}), 7.54(\mathrm{br} . \mathrm{s}, 1 \mathrm{H}$, enolic OH$), 6.43-6.65(\mathrm{~m}, 11 \mathrm{H}$, aromatic). - MS (EI, 70 eV ): m/z $(\%)=415(6)[\mathrm{M}-3]^{+}, 246(35), 245$ (19) [M-pyrazolol ion] ${ }^{+}, 244$ (36), 174 (10), 126 (94) [pyrogallol ion] ${ }^{+}$, 108 (73), 77 (44) [ Ph$]^{+} .-\mathrm{C}_{24} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{O}_{5}$ (418.44): Calcd. ## 4-(Diarylmethyl)-3-methyl-1-phenyl-1H-pyrazol-5-ols (8-10)

These compounds were prepared from equimolar amounts of $\mathbf{2 b}$ or 2c and resorcinol or pyrogallol or 8-hydroxyquinoline ( 0.005 mol ) in
absolute ethanol ( 50 mL ), following the procedure (a) as described above. Crystallization of the product from ethanol gave 8-10.

## 4-[(2,4-Dihydroxyphenyl)(4-hydroxyphenyl)methyl]-3-methyl-1-phenyl-1H-pyrazol-5-ol (8a)

M. p. $210^{\circ} \mathrm{C}$. Yield $42 \%$ (brown powder). - IR (KBr): $v=3450$ $(\mathrm{OH}), 1598(\mathrm{C}=\mathrm{N}), 1500,1426,1270,1274,1041,769 \mathrm{~cm}^{-1} .-$ MS (EI, $70 \mathrm{eV}): \mathrm{m} / \mathrm{z}(\%)=370(11)[\mathrm{M}-\mathrm{OH}]^{+}, 359$ (13) [M-2 OH] ${ }^{+}, 279$ (13) [Mresorcinol ion] ${ }^{+}, 278$ (100) [M-(resorcinol ion + H)] ${ }^{+}, 277$ (48), 215 (20) [M-pyrazolol ion] ${ }^{+}$, 160 (11) [pyrazolol ion-Me] ${ }^{+}, 110$ (46), 109 (15) [resorcinol ion] ${ }^{+}, 94$ (74) $\left[\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{OH}\right]^{+}, 77$ (26) $[\mathrm{Ph}]^{+} .-\mathrm{C}_{23} \mathrm{H}_{20} \mathrm{~N}_{2} \mathrm{O}_{4}$ (388.42): Calcd. N,N'-Di(4-hydroxyphenyl-3-methyl-1-phenyl-5-pyrazolone-4-ylmethyl)-4,4' '-trimethylenedipiperidine (24b)
M. p. 183-185 ${ }^{\circ} \mathrm{C}$. Yield 48 \% (reddish powder). - IR (KBr): $v=$ $3435(\mathrm{OH}), 1640(\mathrm{C}=\mathrm{O}), 1606(\mathrm{C}=\mathrm{N}), 1510,1370,1265,1033,759 \mathrm{~cm}^{-1}$. $-\mathrm{MS}(\mathrm{EI}, 70 \mathrm{eV}): \mathrm{m} / \mathrm{z}(\%)=722(26)[(\mathrm{M}+1)-(2 \mathrm{Me}+\mathrm{OH})]^{+}, 278$ (100), 277 (42), 174 (26), 98 (37), 91 (52), 77 (79) [ Ph$]^{+} .-\mathrm{C}_{47} \mathrm{H}_{54} \mathrm{~N}_{6} \mathrm{O}_{4}$ (766.97): Calcd. C 73.60, H 7.10, N 10.96; found C 73.47, H 6.98, N 10.79.

## Pharmacology

## Materials and Methods

Antioxidant screening; ABTS method (Gazzar, et. al., 2009)
Antioxidant activity determinations were evaluated from the bleaching of ABTS derived radical cations. The radical cation derived from ABTS was prepared by reaction of ABTS $(60 \mu \mathrm{l})$ with $\mathrm{MnO}_{2}$ (3
$\mathrm{mL}, 25 \mathrm{mg} / \mathrm{mL}$ ) in ( 5 mL ) aqueous buffer solution ( pH 7 ). After shaking the solution for a few minutes, it was centrifuged and filtered. The absorbance ( $\mathrm{A}_{\text {control }}$ ) of the resulting green-blue solution (ABTS radical solution) was recorded at $\lambda_{\max } 734 \mathrm{~nm}$. The absorbance ( $\mathrm{A}_{\text {test }}$ ) was measured upon the addition of $(20 \mu \mathrm{~L}$ of $1 \mathrm{mg} / \mathrm{mL})$ solution of the tested sample in spectroscopic grade $\mathrm{MeOH} /$ buffer $(1: 1 \mathrm{v} / \mathrm{v})$ to the ABTS solution. The inhibition ratio (\%) was calculated using the following formula:
$\%$ Inhibition $=\left(\mathrm{A}_{\text {control }}-\mathrm{A}_{\text {test }} / \mathrm{A}_{\text {control }}\right) \times 100$
Ascorbic acid ( $20 \mu \mathrm{~L}, 2 \mathrm{mM}$ ) solution was used as a standard antioxidant (positive control). Blank sample was run using solvent without ABTS.

## Bleomycin-dependent DNA damage

The assay was performed according to (Aeschbach, et al., 1981) and Chan \& Tang (Chan \& Tang 1996), with minor modifications. LAscorbic acid was used as a positive control. The tested compounds were dissolved in DMSO ( $1 \mathrm{mg} / \mathrm{mL}$ ). A mixture of DNA $(0.5 \mathrm{mg} / \mathrm{mL})$, bleomycin sulfate $(0.05 \mathrm{mg} / \mathrm{mL}), \mathrm{MgCl}_{2}(5 \mathrm{mM}), \mathrm{FeCl}_{3}(50 \mathrm{mM})$ and the sample $(20 \mu \mathrm{~L})$ was prepared. The previous mixture $(0.5 \mathrm{~mL})$ was incubated at $37{ }^{\circ} \mathrm{C}$ for 1 h , and then the reaction was terminated by addition of 0.05 mL EDTA $(0.1 \mathrm{M})$. The color was developed by adding thiobarbituric acid (TBA) $(0.5 \mathrm{~mL})(1 \%, \mathrm{w} / \mathrm{v})$ and $\mathrm{HCl}(0.5 \mathrm{~mL})(25 \%$, $\mathrm{v} / \mathrm{v}$ ) followed by heating at $80^{\circ} \mathrm{C}$ for 10 min . After centrifugation, the absorbance of the tested compounds was measured at $\lambda_{\max } 532 \mathrm{~nm}$ the extent of DNA damage was measured by the increase in absorbance.

## Reagents for lymphocyte transformation assay

Heparinized peripheral venous blood was obtained from healthy volunteers from the blood bank of Mansoura University Hospital; Ficoll/Hypaque obtained from Amersham Pharmacia, Uppsala, Sweden; phytohaemagglutinin (PHA) obtained from Difco, Detroit, MI, USA; Concanvalin A (ConA) obtained from Merck, Germany; Hank's balanced salt solution (HBSS); foetal calf serum (FCS); glutamine; HEPES (N-2-hydroxyethylpiperazine-N'-2-ethanesulfonic acid)-buffer and RPMI1640 medium obtained from Gibco BRL, Life Technologies, Pailsey, Scotland; crystalline penicillin G and streptomycin obtained from El-Nile Pharmaceutical Co., Cairo, Egypt.

Standards (+ve) Echinacea Purpurea extract (Immulone ${ }^{\circledR}$ ) obtained from Sekem Pharmaceutial Co., Cairo, Egypt. Levamisole (Ketrax ${ }^{\circledR}$ ) obtained from Elkahira Pharmaceutial Co., Cairo, Egypt (manufactured under license from AstraZeneca, Wilmington, Delaware, USA). Standard (-Ve) Cyclophosphamide (Endoxan ${ }^{\circledR}$ ) obtained from ASTA Medica AG, Frankfurt, Germany. Cyclosporin (Sandimmune Neoral ${ }^{\circledR}$ ) obtained from Novartis Pharma, Switzerland.

## A) Separation of Peripheral Blood Lymphocytes (PBL)

Lymphocytes were separated from peripheral human venous blood by Ficoll/Hypaque gradient technique. For each sample, 5 ml of heparinized blood was diluted with equal volume of Hank's balanced salt solution (HBSS) in a sterile plastic centrifuge tube. Diluted blood ( 6 ml ) was carefully overlaid on 4 ml Ficoll/Hypaque solution gradient without allowing the solution to become mixed by keeping the pipette against the tube wall $5-10 \mathrm{~mm}$ above the fluid meniscus. The tube was centrifuged at 1200 rpm at room temperature. The lymphocytes were localized as a whitish layer on the upper meniscus of the gradient solution. Using a fine pasteur pipette, the zone containing lymphocytes was taken and washed twice in HBSS ( 10 min at 1200 rpm ). The residue is a buffy coat of polymorphonuclear leucocytes (PMNLs).

## B) Lymphocyte transformation assay

The viable lymphocytes were adjusted to a concentration of 2 x $10^{6}$ cells $/ \mathrm{ml}$ in RPMI-1640 medium supplemented with $600 \mu$ penicillin, 0.1 ml streptomycin, $1 \%$ glutamine, $25 \%$ HEPES-buffer, and $20 \%$ foetal calf serum (FCS). The lymphocytes were plated into 96 -well tissue culture plates (or Ependorff tubes). The test solution ( $100 \mu \mathrm{l}$ ) in DMF ( $100 \mu \mathrm{l} / \mathrm{ml}$ ) and $20 \mu \mathrm{~g}$ of the mitogen (PHA) were added to each well. Cell cultures were incubated at $37{ }^{\circ} \mathrm{C}$ in $5 \% \mathrm{CO}_{2}$ atmosphere for 72 hrs , during which the mitogen produced its maximal effect on DNA synthesis. After culture, cell films were stained by Giemsa stain and the average count of percentage of transformed (proliferated) blasts was determined.
