Date: 16/10/2016

A 35 years old gentleman underwent right testis biopsy for his infertility status. A intra-epithelial neoplasm was found. The left testis was removed at age of 8 (it was undescended). His serum testosterone was normal. The right testis size is normal, no mass detected by U/S. Discuss how to manage this case and how can you give him the best opportunity for fertility.

Good Luck

Tanta University

Second paper Doctor degree

Faculty of medicine

Time allowed: 3 hours

Urology Department

Date: 13/10/2016
